Original story · customer edition

The City That Needed More Power

A family science story about electricity, choices, and making room for tomorrow.

MORROW STREET · 4:47 ON THE HOTTEST AFTERNOON

EDITION IDENTITY

The City That Needed More Power — A THYLORA Science Story

Document class	Customer science story with system diagrams and discussion pages
Edition	Edition v2 · THY-ED2-20260917 · supersedes v1 (retained)
Audience	Family and classroom, roughly ages 9 and up
Purpose	A finished digital edition. Print it, mark it up, or use it on screen.
Subject	Morrow Street and one city's electricity system
Rights	Original THYLORA / ErsatzReality work. No third-party rights engaged.
Diagrams	Drawn for this edition. Curve shows shape only, no units claimed.
Delivery	PDF download via the THYLORA library (checkout-email sign-in)

Truth boundary

The city, Morrow Street, Imani, Des and their grandmother are original THYLORA characters. The engineering ideas — supply and demand balance, storage, repair, voluntary load shifting — are described in general terms. No specific Earth utility, outage or measurement is reported as fact.

Recorded as unknown

- THYLORA graphic mark: recorded UNKNOWN / not approved. No logo is drawn.
- Brand font family: recorded UNKNOWN. Families used are PROPOSED — NOT CANON.
- Demand figure is shape only; no numeric load data is held.

ONE

A Million Tiny Requests

At 4:47 on the hottest afternoon of the year, every light on Morrow Street blinked.

Imani froze with the freezer open. Her brother Des looked up from his secondhand computer. Grandmother called from the porch, “If the house is trying to wink at us, tell it I am not impressed.”

Across the city, air conditioners, trains, kitchens, hospitals, chargers, workshops, and computing halls were asking for power at the same time. Supply and demand had to stay balanced. The blink warned that the city needed a better plan.

SAME SUPPLY, FLATTER PEAK · NOTHING WAS ADDED THAT ONE MACHINE COULD HAVE DONE

AT ONE TIME	STREET	WHAT THE BLINK MEANT
4:47, the hottest afternoon of the year	Morrow Street	Supply and demand must stay balanced

TWO

The Loudest Machine

At school, the mayor asked students to design one. Des drew a giant power station. Imani drew solar roofs, batteries, shaded buildings, repaired wires, and schedules that moved flexible work away from the busiest hours.

“Your drawing has too many answers,” Des said. “Yours has one answer pretending to be all of them,” Imani replied.

Their teacher put both drawings up. “Good. Now tell us what each answer cannot do.” Every choice used land, materials, money, time, or trust. Reliability came from designing the system, not worshipping one machine.

THE TEACHER’S MOVE

Not “which is right” but “what can each one not do”. That is the question that turns a drawing into engineering.

ASKED BY	DES DREW	IMANI DREW
The mayor, at school	One giant power station	Roofs, batteries, shade, repair, schedules

THREE

The Night Test

The students tested three blocks. Shops cooled storage early. The library battery supported the block during the evening peak. A laundromat discounted later cycles. Crews replaced a failing transformer. Participation was voluntary.

At 4:47 the next hot afternoon, Morrow Street did not blink. Des checked the meter. “Which thing fixed it?”

“Wrong question,” Imani said. “Which things worked together?” Grandmother nodded. “Now that sounds like somebody who plans to keep the ice cream frozen.”

WHICH THINGS WORKED TOGETHER

TESTED	REPLACED	PARTICIPATION
Three blocks	A failing transformer	Voluntary

FOUR

Room for Tomorrow

The city built new generation, but also wasted less, stored more, repaired equipment, protected hospitals and vulnerable residents, and measured what helped.

ON THE CONTROL-ROOM WALL

Power is not only what we make. It is how carefully we connect need, supply, timing, protection, and choice.

Des added a smaller note: *And never argue with a freezer in August.*

BUILT	PROTECTED	MEASURED
New generation, and less waste	Hospitals and vulnerable residents	What actually helped

USE IT

Talk together

Why did one big answer fail the class test?

What parts of an electric system must work together?

How can a city protect choice while asking people to help?

WORLD NOTE

Reading the diagrams

The city map shows one supply feeding many simultaneous requests, and one battery that can answer locally. The curve shows the *shape* of a hot afternoon before and after the three-block test. It carries no units, because no measured load data is held.

RIGHTS AND ORIGIN

Original THYLORA / ErsatzReality work. No third-party rights engaged. No Earth historical event is represented as fact.

SAME SUPPLY, FLATTER PEAK · NOTHING WAS ADDED THAT ONE MACHINE COULD HAVE DONE ALONE
