

THYLORA STANDARDS SERIES · 01

# QYRIS QuickCheck

## THE NINE-INSPECTION PASS

Twelve minutes. Nine questions. One page you can hand to anyone.

A review asks whether something is good. A QuickCheck asks whether anything is missing, unowned, unproven or unrecoverable — and then routes it.

### INSIDE

- 00

How to run the pass
- 01

Five ways a pass goes weak
- Worked example · a launch, filled in
- The QuickCheck Sheet · fillable, reusable

## BEFORE YOU START

# How to run the pass

Nine inspections, roughly a minute each, then one readiness line. Twelve minutes on your own. Twenty-five with a room. Run it at the start of a thing, again the week before it ships, and again the week after it is live — and keep all three sheets.

## 01 One pass, everything at once

Report every gap you find in a single pass. Handing someone one problem at a time costs them a round trip per problem, and it teaches them to dread the next one.

## 02 Name the route, not just the gap

A gap with no route is not a finding, it is a complaint. Every line gets a next action with an owner and a date, or a named authority it waits on.

## 03 Held is honest. Silent is not

If closing a gap needs an authority you do not have — money, a signature, an account, another person — write HELD and name what it waits on. Never quietly drop it.

## 04 Evidence outranks assertion

“Done” is a claim. A date, a reference, a receipt, a passing test is proof. Where there is no proof, the disposition is OPEN, however confident the room sounds.

### WHEN TO RUN IT

- Before you ship, sign, pay or promise a date.
- When something has been “nearly ready” for the third week running.
- After anything reached a customer that should not have.
- Before you tell anyone outside that a thing is live.

### IF YOU ONLY HAVE FOUR MINUTES

Run inspection 4 and inspection 9. Unproven claims and untested recovery are what actually reach customers.

## INSPECTION 1 AND 2

# Missing prerequisite · Hidden handoff

## 1 Missing prerequisite

*What must already be true for this to work — and is any of it merely assumed?*

### SOUNDS LIKE

- “We’ll sort that out at the end.”
- “It usually just works.”
- “Someone must have done that by now.”

### THE ROUTE

List every precondition in one place. For each, name the thing that checks it. Where nothing checks it, that check is the work — and it belongs before the step it protects, not after.

**Can you point at the thing that refuses to proceed when the precondition is missing?**

## 2 Hidden handoff

*Where does this pass between people, teams or systems with no record of the pass?*

### SOUNDS LIKE

- “I sent it over.”
- “It’s with them now.”
- “I thought you had it.”

### THE ROUTE

Give every handoff a record written by the system, not by memory: who moved it, when, out of what state and into what state. A trail nobody has to be present to reconstruct.

**If everyone involved were unreachable tomorrow, could a stranger say where this is?**

### WHY THESE TWO TOGETHER

Prerequisites and handoffs are the same failure seen from two angles: work that moves before it is ready, and work that moves without leaving a mark. Run them together and you learn both what was skipped and the exact place it was skipped.

# 01

## INSPECTION 3 AND 4

# Authority mismatch · Evidence gap

## 3 Authority mismatch

*Who can do this, and who is allowed to decide it — and are those the same list by accident?*

### SOUNDS LIKE

- “They have access, so it’s fine.”
- “I just approved it myself.”
- “Whoever gets there first.”

### THE ROUTE

Separate access from authority in writing. Read is not write. Write is not approve. Approve is not pay. Where the system cannot hold the line, the line does not exist.

**Name one person with access who must not be able to decide. If you cannot, the boundary is not real yet.**

## 4 Evidence gap

*What is being asserted here with nothing attached to it?*

### SOUNDS LIKE

- “It’s live.”
- “That’s been paid.”
- “We tested that.” — no date, no reference, no link.

### THE ROUTE

Attach the proof to the claim: a date, a reference number, a receipt, a screenshot, a passing test. A claim with no proof is marked OPEN, not TRUE — and a number nobody measured is named as unmeasured rather than estimated.

**For the three most important claims here, can you produce the proof in under a minute?**

### WHY THESE TWO TOGETHER

Authority and evidence are what an outsider checks first. Who was allowed to do this, and what proves it happened? Something that cannot answer both is not finished, however well it happens to be working today.

# 02

## INSPECTION 5 AND 6

# Unnecessary waiting · Customer friction

## 5 Unnecessary waiting

*What is stopped that does not actually need to be stopped?*

### SOUNDS LIKE

- “We’re blocked until?”
- “No point starting before?”
- “Waiting on a decision.”

### THE ROUTE

Split the work in two: the part that genuinely needs the blocker, and the part that does not. Start the second half today. Then say out loud what the waiting costs per week — in money, in position, or in trust.

**Name the first real task the blocker genuinely prevents. Everything before it is available now.**

## 6 Customer friction

*Where does the person on the other side hit a wall with no reason and no way forward?*

### SOUNDS LIKE

- “They can just email us.”
- “It’s obvious once you know.”
- “Error. Please try again.”

### THE ROUTE

Every refusal carries three things: what happened, why, and the one next step. Anything a customer paid for stays theirs — including after they cancel, and including their own work.

**Read your worst error message out loud to someone outside the work, and watch their face.**

### WHY THESE TWO TOGETHER

Waiting and friction are the two costs nobody invoices for. One is paid by your own people in idle weeks. The other is paid by customers, quietly, and usually only once.

# 03

## INSPECTION 7 AND 8

# Rights and privacy risk · Value left on the table

## 7 Rights and privacy risk

*What is being collected, kept, shown or implied that you would not defend out loud?*

### SOUNDS LIKE

- “We keep everything, just in case.”
- “It’s only internal.”
- “Nobody will ask where it came from.”

### THE ROUTE

Collect the least that does the job, and delete the rest on a clock. Say where material came from and what you are permitted to do with it. Label anything simulated as simulated. Give every refusal an appeal.

**Could you show this data model, and this list of sources, to the person it describes?**

## 8 Value left on the table

*What is already built, already paid for or already working that nobody is using or earning from?*

### SOUNDS LIKE

- “That’s just internal.”
- “We never finished packaging it.”
- “One price, take it or leave it.”

### THE ROUTE

List what already exists. For each, name one audience and one way it could pay for itself — or retire it deliberately. Where money reaches you through someone else’s click, disclose it in the same breath.

**Name the most valuable thing here that currently has exactly one use.**

### WHY THESE TWO TOGETHER

Rights and value pull against each other on purpose. Inspection 7 asks what you should not be doing with what you hold; inspection 8 asks what you should be doing with it and are not. Run them back to back or you will drift into one of them.

# 04

## INSPECTION 9 AND DISPOSITION

# Failure and recovery

## 9 Failure and recovery

*When this breaks — not if — what happens, and what can be undone?*

### SOUNDS LIKE

- “It shouldn’t fail.”
- “We’d restore from backup.” — never tested.
- “We’d fix it manually.”

### THE ROUTE

Write the failure down and write the recovery beside it. A new version never overwrites the old one. Money that cannot be allocated is reported, never absorbed. Then perform the recovery once, on purpose, while nothing is on fire.

**When did you last actually perform the recovery, rather than describe it?**

### DISPOSITION

## Three words, and only three

### ROUTED

Handled in this pass, or the route is written down with an owner and a date against it. Routed is not “we discussed it”.

### HELD

Real, and it needs an authority you do not have. Name the authority, name what it waits on, and name what the waiting costs per week. Held is a legitimate answer. Held with no name attached is not.

### OPEN

Found, no route yet. The dangerous one, because it looks like progress. Every OPEN gets a date before the pass closes, even if the date is only “decide by Friday”.

**No gap is reported and left unrouted where a safe, reversible route exists. If the route is safe and you can undo it, take it now and write ROUTED.**

### WHY THESE TWO TOGETHER

Inspection 9 gets skipped because it describes a day that has not happened yet. Disposition is what stops the other eight becoming a list nobody acts on. Together they are the difference between a pass and a document.

# 05

## CLOSING THE PASS

# Scoring and the readiness line

A pass ends in one sentence you can say out loud without softening it.

## READINESS LINE

**9 inspected · 7 routed · 2 held against a named authority · 0 open.**

### 01 Zero open is the bar to move

An OPEN item is a gap you have seen and not decided about. Moving with one is a choice; make it deliberately and write it down.

### 02 Held may be non-zero, and must be named

Every HELD line names the authority, what it waits on, and the weekly cost of waiting. Three HELD items with owners beat one vague “in progress”.

### 03 Nine routed and no evidence is not a pass

Spot-check two routes at random. Ask for the proof, not the plan. If neither survives, run the pass again properly.

### 04 Do not re-score to look better

The count is a record, not a grade. A pass that flatters you has cost you the only thing it was for.

## BLOCKER CARD · HELD OR OPEN

- ID and one-line name — so it can be carried forward verbatim.
- Severity — HARD (nothing proceeds), BY RULE (held deliberately), EVIDENCE GAP (unproven), or COST (needs spend).
- The consequence, carried honestly — what is untrue or unknown while this stands.
- What it needs — the specific authority, account, signature, person or measurement.
- Who can give it — a name, not a department.

# 06

## QUALITY CONTROL

# Five ways a pass goes weak

Each of these looks like a completed pass from the outside. Each is worth nothing.

## 01 The nod-through *Nine ticks in four minutes.*

Require one verbatim quote or one artefact per inspection. If you cannot quote or point, you did not inspect.

## 02 The blame pass *Findings aimed at people.*

Route to a mechanism, never a name. The record is what failed, not who was near it. People read the sheet; make it safe to hand over.

## 03 The list with no owner *Findings with nothing beside them.*

Every ROUTED carries an owner and a date. Every HELD carries an authority. Unowned findings decay into folklore.

## 04 The silent drop *A finding that vanishes between passes.*

Carry every OPEN and HELD forward verbatim into the next sheet, with its age in days. Age is the most honest metric on the page.

## 05 The polish trap *Fixing the readable things, leaving the unproven ones.*

When short of time, run inspections 4 and 9 first. Unproven claims and untested recovery are what reach customers.

### RUNNING IT WITH OTHER PEOPLE

- One inspection at a time, out loud, going round the room. Twenty-five minutes.
- The person closest to the work speaks last, so the room's first answer is not theirs.
- Write findings in the words that were actually said. Cleaned-up language hides the gap.
- Close on the readiness line, read aloud, by the person who owns the thing.

# 07

# A first digital product, going live on Friday

One person, one store, one \$29 downloadable guide. Fourteen minutes, on a Tuesday.  
Findings are written here as they were written on the day.

| INSPECTION                | WHAT THE PASS FOUND                                                                                                                   | DISPOSITION | ROUTE, OWNER, DATE                                                                                                             |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1 Missing prerequisite    | Nothing checks that the file a customer downloads is the final build. The link points at whatever is in the folder.                   | ROUTED      | Delivery reads a named build with a checksum; a mismatch refuses to deliver. Me · today                                        |
| 2 Hidden handoff          | Payment confirmation and file delivery are two tools with nothing joining them. If delivery fails, nobody finds out but the customer. | ROUTED      | Order reference written into the delivery record; daily count of paid-but-undelivered. Me · Friday                             |
| 3 Authority mismatch      | Three people can change the live price. Nobody ever agreed who sets it.                                                               | ROUTED      | A price change needs the same approval as a refund. Written into the store notes. Me · today                                   |
| 4 Evidence gap            | "Tested on mobile" was one person, one phone, once.                                                                                   | ROUTED      | Phone, tablet and desktop, screenshots kept with the release note. Me · Thursday                                               |
| 5 Unnecessary waiting     | The whole launch was waiting on a logo refresh that is three weeks out.                                                               | ROUTED      | Launch on the current mark. The refresh ships as an updated download, free, through re-access. Me · now                        |
| 6 Customer friction       | If the download link expires there is no way back in except emailing me.                                                              | ROUTED      | Purchase grants a permanent entitlement; re-access by order reference, no email needed. Me · Friday                            |
| 7 Rights and privacy risk | Checkout collects a postal address. For a file download.                                                                              | ROUTED      | Field removed. Only what a receipt legally needs. Me · today                                                                   |
| 8 Value left on the table | The worked example inside the guide is the most-quoted page and exists nowhere else.                                                  | HELD        | Sell it standalone once the store carries a second SKU. Authority: me + store build. Costs roughly one missed upsell per sale. |
| 9 Failure and recovery    | Nobody has ever run a refund on this store. Not once.                                                                                 | ROUTED      | One test purchase and one test refund, both recorded, before Friday. Me · Thursday                                             |

READINESS LINE

9 inspected · 8 routed · 1 held against a named authority · 0 open. Moving Friday.

WHAT IT COST, WHAT IT CAUGHT

Fourteen minutes. It caught two failures that would have reached a paying customer — the wrong file going out, and no way back in when a link expired — and it ended three weeks of waiting on a logo that no customer was waiting for.

WHAT HAPPENED TO THE ONE HELD ITEM

Finding 8 was carried forward verbatim into the next pass at seven days, and again at fourteen, still HELD and still named. That is the whole point of carrying it: nothing quietly disappeared, and the age on the line made the cost of waiting impossible to ignore.

The blank sheet for this pass is on the next page — print it, or type into it.

Artifact engine, layout and typesetting · THYLORA Artifact Engine v1

Worked example · a THYLORA first-digital-product launch, recorded as it ran

**PROVENANCE**

Derived from the QYRIS inspection discipline recorded in workroom WR-RAELINK-001 (THYLORA, 11 September 2026), where the same nine inspections were run against a forty-table backend and twenty-eight gaps were found, routed or held. This artifact is the customer-usable form of that discipline. Typeset by the THYLORA Artifact Engine v1: vector pages, no embedded font, no external asset, deterministic rebuild.

**RIGHTS**

(c) 2026 THYLORA. Licensed to the named serial holder for their own work and their organisation's internal use, including printing the sheet as often as they like. Not licensed for resale, redistribution, public posting or inclusion in a paid course. The licence does not expire and is not revoked by ending a membership.

**RE-ACCESS**

Your purchase entitlement is permanent. Re-access is by serial or order reference through the THYLORA store account that bought it — no email required, no expiry, and ending a membership never removes it. A corrected or extended edition is delivered to the same entitlement at no further cost, carrying the same serial with a new edition line.

**WHAT THIS IS NOT**

This is a thinking instrument. It is not legal, financial, medical, tax or safety advice, and it does not replace a regulated review where one is required.

It finds gaps. It does not close them. Every route on the sheet needs a person and a date or it is decoration.

A pass is a record of what you saw on one day. Keep the old sheets: the drift between them is worth more than any single pass.
